

Graphs made using the pandas rolling function, centered on each data point with min periods at 1
This means that values on the edges are calculated with as few as half the data points of most values.

Window size for each graph:

Temp = 20k

HR = 8k

HRV = 8k

GSR = 6k

SpO2 = 6k

CT = 8k

Pupil values = 18.5k

The line across is the mean value of the raw data, provided as a reference for the level of variation
